

§2.4 能量估计

能量估计是先验估计, 主要利用方程来估计 $\int |\nabla u|^2 dx$ 与 $\int |u|^2 dx$.

Thm 2.28 设 $c(x) \geq c_0 > 0$, $u \in C^2(\Omega) \cap C^1(\bar{\Omega})$ 满足

$$\begin{cases} -\Delta u + c(x)u = f & \text{in } \Omega \\ u = 0 & \text{on } \partial\Omega \end{cases} \quad (2.45)$$

则 $\exists M = M(c_0) > 0$ s.t.

$$\int_{\Omega} |\nabla u|^2 dx + \frac{c_0}{2} \int_{\Omega} |u(x)|^2 dx \leq M \int_{\Omega} |f(x)|^2 dx,$$

pf, 方程两边同时乘 u , 并在 Ω 上积分

$$-\int_{\Omega} \Delta u u dx + \int_{\Omega} c(x) u^2 dx = \int_{\Omega} f u dx$$

利用 Green 公式,

$$\int_{\Omega} \Delta u u dx + \int_{\Omega} |\nabla u|^2 dx = \int_{\partial\Omega} \frac{\partial u}{\partial n} u dx = 0,$$

则有

$$\int_{\Omega} |\nabla u|^2 dx + \int_{\Omega} c(x) u^2 dx = \int_{\Omega} f u dx.$$

利用 Cauchy 不等式 $\forall \varepsilon > 0$

$$|f u| \leq \frac{1}{2} \varepsilon |u|^2 + \frac{1}{2\varepsilon} |f|^2$$

以及

$$\int_{\Omega} c(x) u^2 dx \geq c_0 \int_{\Omega} |u|^2 dx$$

于是有

$$\int_{\Omega} (|\nabla u|^2 + c_0 u^2) dx \leq \frac{\varepsilon}{2} \int_{\Omega} |u|^2 dx + \frac{1}{2\varepsilon} \int_{\Omega} |f|^2 dx$$

取 $\varepsilon = c_0$, 则有

$$\int_{\Omega} |\nabla u|^2 + \frac{c_0}{2} u^2 dx \leq \frac{1}{2c_0} \int_{\Omega} |f|^2 dx =: M \int_{\Omega} |f|^2 dx. \quad \square$$

Lemma 2.29 (Friedrichs 不等式) 设 $u \in C_0^1(\Omega)$, 则

Lemma 2.29 (Friedrichs 不等式) 设 $u \in C_0^1(\Omega)$, 则

$$\int_{\Omega} |u|^2 dx \leq 4d^2 \int_{\Omega} |\nabla u|^2 dx,$$

其中 d 为 Ω 的直径.

pf 由

$$d := \sup_{x, y \in \Omega} |x - y| < +\infty,$$

则存在正方体 $Q \subseteq \mathbb{R}^n$ s.t. $\Omega \subset Q$. 不妨设

$$Q = \{x = (x_1, x_2, \dots, x_n) : 0 \leq x_i \leq 2d, i = 1, 2, \dots, n\}$$

令

$$\tilde{u}(x) = \begin{cases} u & x \in \Omega \\ 0 & x \in Q \setminus \Omega \end{cases}$$

做零延拓

则 $\tilde{u} \in C_0^1(Q)$. 注意到

$$\tilde{u}(x) = \int_0^{x_1} \frac{\partial \tilde{u}}{\partial \xi}(\xi, x_2, \dots, x_n) d\xi$$

利用 Holder 不等式 (Schwarz 不等式)

$$\int_{\Omega} f(x) g(x) dx \leq \left(\int_{\Omega} |f|^2 dx \right)^{\frac{1}{2}} \left(\int_{\Omega} |g|^2 dx \right)^{\frac{1}{2}}$$

$$\tilde{u}(x) = \int_0^{x_1} \frac{\partial \tilde{u}}{\partial \xi} \cdot 1 d\xi \leq \left(\int_0^{x_1} \left| \frac{\partial \tilde{u}}{\partial \xi} \right|^2 d\xi \right)^{\frac{1}{2}} \left(\int_0^{x_1} 1 d\xi \right)^{\frac{1}{2}}$$

i.e.

$$|\tilde{u}(x)|^2 \leq x_1 \int_0^{x_1} \left| \frac{\partial \tilde{u}}{\partial \xi} \right|^2 d\xi \leq 2d \int_0^{2d} \left| \frac{\partial \tilde{u}}{\partial \xi} \right|^2 d\xi$$

两边在 Q 上积分, 并交换积分次序

$$\begin{aligned} \int_Q |\tilde{u}(x)|^2 dx &\leq 2d \int_Q \int_0^{2d} \left| \frac{\partial \tilde{u}}{\partial \xi} \right|^2 d\xi dx \\ &= (2d)^2 \int_Q \left| \frac{\partial \tilde{u}}{\partial x_1} \right|^2 dx \\ &\leq (2d)^2 \int_Q |\nabla \tilde{u}|^2 dx \end{aligned}$$

再由 $\tilde{u}$ 的定义得

$$\int_{\Omega} |u|^2 dx \leq 4d^2 \int_{\Omega} |\nabla u|^2 dx$$

□

Thm 2.30, 设 $c(x) \geq 0$, $u \in C^2(\Omega) \cap C^1(\bar{\Omega})$ 满足

$$\begin{cases} -\Delta u + c(x)u = f(x) & \text{in } \Omega \end{cases}$$

(2.45)

$$\begin{cases} -\Delta u + c(x)u = f(x) & \text{in } \Omega \\ u=0 & \text{on } \partial\Omega \end{cases} \quad (2.45)$$

则 $\exists M = M(d) > 0$ s.t.

$$\int_{\Omega} (|\nabla u|^2 + u^2) dx \leq M \int_{\Omega} |f|^2 dx.$$

pf, 由 Thm 2.28 中证明知

$$\int_{\Omega} |\nabla u|^2 + c(x)u^2 dx = \int_{\Omega} f u dx$$

利用 $c(x) \geq 0$ 以及 Cauchy 不等式, $\forall \varepsilon > 0$

$$\int_{\Omega} |\nabla u|^2 dx \leq \frac{\varepsilon}{2} \int_{\Omega} |u|^2 dx + \frac{1}{2\varepsilon} \int_{\Omega} |f|^2 dx$$

利用 Friedrichs 不等式

$$\int_{\Omega} |\nabla u|^2 dx \leq \frac{\varepsilon}{2} 4d^2 \int_{\Omega} |\nabla u|^2 dx + \frac{1}{2\varepsilon} \int_{\Omega} |f|^2 dx$$

取 $\varepsilon = \frac{1}{4d^2}$ s.t. $2\varepsilon d^2 = \frac{1}{2}$, 则

$$\int_{\Omega} |\nabla u|^2 dx \leq \frac{1}{2} \int_{\Omega} |\nabla u|^2 dx + 2d^2 \int_{\Omega} |f|^2 dx$$

i.e.

$$\int_{\Omega} |\nabla u|^2 dx \leq 4d^2 \int_{\Omega} |f|^2 dx.$$

再利用 Friedrich 不等式

$$\frac{1}{4d^2} \int_{\Omega} |u|^2 dx \leq \int_{\Omega} |\nabla u|^2 dx \leq 4d^2 \int_{\Omega} |f|^2 dx \quad \text{i.e.} \quad \int_{\Omega} u^2 dx \leq 16d^4 \int_{\Omega} |f|^2 dx$$

于是

$$\int_{\Omega} (|\nabla u|^2 + u^2) dx \leq (4d^2 + 16d^4) \int_{\Omega} |f|^2 dx =: M \int_{\Omega} |f|^2 dx. \quad \square$$

Thm 2.31 设 $c(x) \geq c_0 > 0$, $\alpha(x) \geq 0$, 若 $u \in C^2(\Omega) \cap C^1(\bar{\Omega})$ 满足

$$\begin{cases} -\Delta u + c(x)u = f & \text{in } \Omega \\ \frac{\partial u}{\partial n} + \alpha(x)u = 0 & \text{on } \partial\Omega \end{cases}$$

则 $\exists M = M(c_0) > 0$ s.t.

$$\int_{\Omega} |\nabla u|^2 dx + \frac{c_0}{2} \int_{\Omega} u^2 dx + \int_{\partial\Omega} \alpha(x) u^2 ds_x \leq M \int_{\Omega} |f|^2 dx.$$

pf, 练习作业.
